Contents show] Onscreen Controls Edit The controls and settings located on the screen that are accessible by the mouse. Left mouse: Horizontal select handles (a set of four little dots) that allow you to resize an image. Right mouse: Vertical select handles (a set of four little dots) that allow you to move an image up, down, left, and right. Direct Selection tool: Moves the cursor over a specific area of an image and does what is selected. Lasso tool: A selection tool similar to the direct selection tool, except it works in a slightly different manner. Instead of drawing an outline, you can use the Lasso tool to select an area by clicking and dragging. Rectangular Selection tool: The rectangular selection tool allows you to select portions of an image. This tool includes the polygon tool, which allows you to use an extremely precise amount of control over the image. Quick Selection tool: The Quick Selection tool allows you to perform a selection by painting a shape. You can change the selected area by clicking and dragging the shape. Pen tool: This tool is used for drawing or painting in a digital image. Unlike the Quick Selection tool, the Pen tool lets you

change the selected area by dragging the pen over it instead of simply clicking and dragging. Shape tools: In the same category as the Pen tool, the Shape tool enables you to paint in a digital image, with a limited degree of control. Direct Selection tools Edit Animate: Direct Selection tools: The animation tools in the Select menu are the last set of tools you will use most frequently. This tool enables you to animate the movement of one area of an image or of the entire image. Magic Wand: This tool is used to select an entire image and is similar to the Create new selection tool, except that it selects everything that's black and white in a selected area. Invert: This tool inverts the image, meaning that it selects everything that is not white and black. Motion: This tool allows you to apply the effects of a motion path to a selected area, similar to the way you would change the size of a text layer, or the position of a layer in the Layers panel. You can then move that shape by selecting the Motion tool and dragging across the page. Auto-Align: This tool is used to automatically align shapes and selects the shape that is

What's New in the Adobe Photoshop CS6?

Q: What's the symbol for the inner product, $\langle u, v \rangle$? I'm not sure what the symbol for the inner product is in a complex inner product space. I assume it should be the generalization of the dot product where the row and columns are vectors. What is the symbol? A: Its just $\langle u, v \rangle$ A: In this case, it would be $\langle u, v \rangle$. I've taken the liberty of adding the angle bracket because the OP didn't specify whether v is an arbitrary vector or its representation in terms of rows and columns. The context determines which usage is more appropriate.

Q: CakePHP: Run select through content function for each sub-data group I have a query such as the following: `SELECT c.company_id AS id, c.company_name, GROUP_CONCAT(x.x_id) as x_ids FROM companies c LEFT JOIN companies_x x ON c.company_id = x.company_id GROUP BY c.company_id` And I'm using the following code to output the resulting HTML: `$\$i = 0;$ while ($\$i < \text{count}(\text{\$x_ids}); \text{\$i}++;$)` Which works, but I'd like to group the `x_id` values as well so I don't need to do `$\text{\$i}++;$` two times. How can I go about doing that? As always, CakePHP or MySQL answers are fine, this is more of a brain dump question to get the juices flowing. A: `SELECT`

c.company_id AS id, c.company_name,
GROUP_CONCAT(x.x_id) AS x_ids FROM companies c
LEFT JOIN companies_x x ON c.company_id =
x.company_id GROUP BY c.company_id Then to render in
