This is my first Ubuntu server deployment. I am trying to connect to the server via command line (ssh) from my local Windows box. I am having issues connecting to the server from my local PC. The command I am trying is: ssh -i "c:\users\myname\desktop\pemfile.pem" -i "C:\Program Files\PutTY\putty.exe" -ssh username@server.com I am receiving the following error: Name or service not known I was able to connect successfully before I created the pem file. Does anyone know what I am doing wrong? A: As @High Sierra pointed out, the server is running OpenSSH. So you need to install the openssh-server package on the server, so the server knows what it is called and how to communicate with it. Install OpenSSH on the server sudo apt-get update sudo apt-get install openssh-server Make sure openssh is started sudo service ssh start Use putty Open putty and select your public key file. Select File -> Load the private key file -> Browse the file and select the file created by the openssh-server Test ssh connection If that does not work out, then you have to download and use the private key file. Get the private key file from the server ssh -i "c:\users\myname\desktop\pemfile.pem" -i "C:\Program Files\PutTY\putty.exe" -ssh username@server.com
