In the search for new solar cells that can generate electricity at lower cost and higher efficiency, researchers at the Stanford University have developed a nanowire design that is efficient even at a lower solar concentration. The solar cell, which consists of long and tightly packed nanowires, can use air as a selective absorber, making it less expensive to manufacture than the conventional two-dimensional solar cell. The research, published in the Proceedings of the National Academy of Sciences, could soon lead to the development of low-cost and high-efficiency solar cells. Last year, the National Science Foundation and the U.S. Department of Energy announced an effort to develop low-cost solar cells that are at least 15% efficient, which would be roughly equivalent to the efficiency of rooftop solar. The cost of a 15% efficient solar cell is still much higher than that of conventional solar cell, however, which raises the question of whether a new design can reach this efficiency level without breaking the bank. “It’s a very important question, because the solar industry is currently developing ways to install low-cost solar electricity at massive scales,” said Jamie Hyslop, a Stanford assistant professor of physics and of materials science and engineering, who led the research.

For the past decade, the mainstream solar cell has used a two-dimensional design, consisting of a thin film of silicon on an absorber layer. A silicon-based two-dimensional solar cell is less efficient than a solar cell made using a single-crystalline silicon, which is much denser than a thin film. The reason is that the single-crystal silicon retains energy that could be converted to electricity. The Stanford researchers, however, discovered that a nanowire-based solar cell design is much more efficient than its two-dimensional counterpart. The nanowire cells

are made of tightly packed, cylindrical silicon nanowires — so packed that when you look down upon a sheet of nanowire solar cells, it looks like one long tube. The single-crystalline silicon nanowires that make up the cylindrical nanowire cell are much denser than the two-dimensional material, so the nanowire cells are much more efficient. The researchers also found that as the distance between the nanowires decreases, the device becomes more efficient. Nanowire 3da54e8ca3
